

IN THE CLAIMS

Please amend the claims as follows:

1. (original) Device for placing a lamp in a reflector, said device comprising:

- a socket for holding a lamp and
- a back plate to be secured to the reflector,

characterized in that

 said socket (1) is provided with a main body part (2), with a reference plane (16) to be brought into contact with the a reflector surface, with means (3) for holding the lamp at one side of the reference plane, with a resilient annular spring (5) secured to the main body part at the opposite side of the reference plane, and with two upright arms (7) provided with clicks (8),

 said back plate (11) being provided with pressure points (14),

wherein, when securing the back plate to the reflector, the reference plane (16) is brought into contact with said reflector surface, and the pressure points (14), when in contact with the clicks (8) of the socket, displace the clicks (8) in the direction of the reflector over a distance Δx so as to put the annular spring (5) under tension, said distance Δx being such that the annular spring (5) presses the reference plane towards said reflector

surface with a force of at least 5N, preferably with a force of at least 10 N.

2. (original) Device according to claim 1, characterized in that the clicks (8) are displaced by the pressure points (14) over a distance ranging from 0.5 mm up to 2 mm, preferably 0.8 mm to 1.3 mm.

3. (currently amended) Device according to claim 1-~~or~~-2, characterized in that the main body part (2) is provided with two electrically conducting female terminals (10), and the back plate (11) is provided with two mating electrically conducting male terminals (13) such that, when the back plate is moved towards the socket, the male terminal (13) is inserted with friction into the female terminal (10) so as to hold the back plate and socket together and to position the pressure points (14) with respect to the clicks (8).

4. (currently amended) Device according to ~~any one of the preceding claims~~claim 1, characterized in that the socket (1) is formed as an integral part from a synthetic resin, preferably polyamide.

5. (currently amended) Device according to ~~any one of the preceding claims~~claim 1, characterized in that the back plate (11) is made from an electrically insulating material and is provided with one or more printed circuit(s) connected to the male terminals (13).

6. (currently amended) Device according to ~~any one of the preceding claims~~claim 1, characterized in that the back plate comprises more than one set of pressure points (14) to bring an equal number of sockets into contact with a reflector unit provided with a number of reflectors.

7. (currently amended) Socket for use in a device as claimed in ~~any one of the claims 1 to 6~~claim 1.

8. (currently amended) Back plate for use in a device as claimed in ~~any one of the claims 1 to 6~~claim 1.
